Generated 06 September 2026 · figures measured from the 21 August 2026 database

Manik Chand Jewellers

Purpose. Settle every question the data cannot answer, so the rebuild stops guessing. Each item below is open because the answer is a fact about how the shop worked, and inventing one would put a wrong number on a screen with a confident face.

Every figure here has been measured against the database directly, not copied from working notes. Where a figure could not be reproduced that way it has been replaced by one that could, and the substitution is noted on the item. Nothing is estimated and nothing is rounded for effect.

Length. About four hours with two breaks. **Present.** The owner throughout; the CA for blocks 2 and 3, and welcome for block 1.

At a glance — the ten that matter most

		Item
₹15.32 cr	The opening trial balance does not tie — and does not tie in the following year either	7
₹11.55 cr	739 of 1,023 gold pieces carry no hallmark record	2
₹10.73 cr	75% of the shelf is photographed only on servers the shop does not control	*ours*
₹10.69 cr	The order book may be worth ₹13.38 crore, not the ₹2.69 crore we show	1
₹8.80 cr	Opening balances with no transaction behind them — only ₹46,252 came from a posting	3
₹1.35 cr	869.850 g of gold went to the goldsmith and nothing records it coming back — **one answer also releases fourteen screens**	5
₹1.27 cr	The shelf carries two values and they are this far apart — 2,570 of 2,575 tags differ	4
₹77.48 L	Owed on 173 completed savings schemes, not one of them marked closed	21
₹28.95 L	Purchase value sitting outside the taxable base on 11 mixed bills	16
nil	There is no TDS data in the records at all — not a rate, not a figure	19

If only one thing gets decided, make it item 5. It settles ₹1.35 crore of gold and decides whether a quarter of the remaining work gets built.

Before relying on any figure here — please read this

What this document is. A list of the things the shop's own records cannot settle, with the measurement behind each one. It is not an audit, an accounting opinion or a tax opinion, and it does not attempt to be. Where it touches the books or the returns, **the CA's view governs, not ours.**

Where the figures come from. All of them are counts and sums taken from a single copy of the shop's database, dated **21 August 2026** — 37.4 MB, **149 tables** — together with **354 screens** captured from the old system on the same day. The old system went offline that day and has not been reachable since, so nothing here has been re-checked against a live system, and it cannot be.

How that copy was obtained, because it matters for provenance. It is the output of the old system's own Backup screen, fetched over the web. It is therefore exactly what that system chose to export — not a database-level dump taken by an administrator — and we have not been able to verify it against the original server.

The capture is incomplete, and we know where. Of the 354 screens, **276 came back**; **64 returned a server-busy error**, 8 were not found, 3 failed outright and 3 could not be reached. Several tables the old menu clearly implies — including the register behind TDS on job charges — **are not in the 149 at all.**

Every figure is measured, and none is estimated. Nothing has been rounded to make a point and no number here is inferred from another. Where a figure could be read more than one way, both readings are given and the choice is left to the meeting — item 1 is the clearest example.

Absence of a record is not evidence that the thing did not happen. This is the most important caution in the document. When we say there is no record of the gold coming back, of TDS being deducted, or of a repair being billed, we mean the records do not show it — **not that it did not occur.** Several items here exist precisely because a missing record has two innocent explanations and we cannot tell them apart.

Nothing in the shop's data has been changed. No balance has been corrected, no duplicate removed and no record deleted. Where something looks wrong it is listed here for a decision, not fixed quietly.

Figures are as at the date above. Gold values marked "at today's rate" use ₹15,482 per gram for 995 fine and will move with the market.

Before the session — please have to hand

- **One physical tag**, any piece, for the label check in block 6.
- **The GST returns for the year** — for the tax questions in block 3.
- **The TDS returns for the year (Form 26Q), and any Form 16A certificates issued to goldsmiths.** These are a *different* filing from the GST returns. There is no TDS data of any kind in the records, so if TDS was deducted on job work, these filings are the only place it still exists.
- **Anything showing what MA TARA JEWELLERS returned** — on paper or otherwise. It is the largest single open figure and the one that unlocks the most work.
- **Whoever ran the old system day to day**, if that is not the owner. Several questions are about what a flag meant to the person entering it, and only that person can say.

Running order

	Block	Who	Time
1	Money that may be wrong	Owner + CA	60 min
2	The books	CA-led	45 min
3	GST and statutory	CA-led	40 min
—	*Break*		15 min
4	How the shop worked	Owner	60 min
5	Scope and cost	Owner	30 min
6	Fast confirmations	Owner	20 min

BLOCK 1 — Money that may be wrong

The six largest numbers in the system. Each one changes if the answer changes.

1. The order book may be worth ₹13.38 crore, not the ₹2.69 crore we show

The order records carry two value columns. The one being read is **zero on 185 of 366 lines** — more than half the book. Read that way the orders total **₹2,68,52,217**; read the other way, **₹13,37,70,389**.

The evidence favours the larger figure: on **193 of 271 orders** the order header agrees with it, and nothing corroborates the smaller. But a **₹10.69 crore** difference is not ours to choose.

Decide: which column was the order's real worth. **Then:** the figure changes on every order screen and every order report.

2. 739 of 1,023 gold pieces carry no hallmark record — ₹11,54,63,861

Either they were never hallmarked, or they were and nobody wrote it down. The flag is in live use and climbing: **6.1%** of the gold jewellery tagged in 2024 carries it.

Decide: never hallmarked, or hallmarked and unrecorded. **Then:** it changes what can be said about a piece at the point of sale.

3. ₹8.8 crore of opening balances have no transactions behind them

SHREE SAROJ JEWELSS shows **₹6,98,45,346** owing. Ten other accounts hold **₹2,01,01,051** between them with **not one transaction ever posted**. Across the whole amount, **₹8,80,38,622 is opening balances** and only **₹46,252** came from an actual posting.

Decide: are these live receivables, or balances carried over from something already settled? **Then:** the receivable report and the balance sheet both move.

4. The shelf carries two values, ₹1.27 crore apart, and both are in the data

Every tag holds two figures. Added up across the **2,575 pieces on the shelf** they give **₹14,23,61,188.20** one way and **₹12,97,04,187.18** the other — **₹1,26,57,001.02** apart. **2,570 of the 2,575 tags differ**, so this is not a handful of odd rows; it is how the tags were written.

The difference is stones: one figure includes them and the other does not.

Decide: which figure is the shelf's value — and more generally, the rule (cost, current metal rate, or something else). **Then:** every stock valuation follows it, and the trial balance question in block 2 depends on it too.

5. 869.850 g of 995 fine gold went to MA TARA JEWELLERS and nothing records it coming back

Issued **16 September 2025** on two bills, C4/00001 and C4/00002 — **₹99,31,077** at the rate written on the issue, **₹1,34,67,017** at today's ₹15,482. His account carries an opening balance of zero and **not a single posting**. Nothing records a return either.

Decide: (a) still with him · (b) returned and the paperwork simply stopped · (c) an abandoned trial. **Then:** (a) or (b) loads his position and releases **fourteen goldsmith screens**; (c) leaves them read-only.

This is the highest-leverage answer in the whole session.

6. On 78 of 271 orders the header and the lines disagree

Always higher, never lower — **₹1,06,00,834** in total.

Decide: which figure is the order's value. Item 1 probably settles this too.

BLOCK 2 — The books

CA-led. The accounting position as the records stand.

7. The opening trial balance does not tie, in either year

Opening trial balance	Ledgers	Debit	Credit	Short on debit
FY 2026-27	353	₹10,80,37,319.15	₹26,12,65,922.64	**₹15,32,28,603.49**
FY 2027-28	186	₹10,62,76,061.42	₹27,06,82,293.35	**₹16,44,06,231.93**

This is how the books were kept, not a fault in the migration — it repeats across two independent opening tables that the shop rolled forward separately.

By contrast the transactions are sound: 5,229 voucher lines balance to within ₹0.01.

8. The missing debit is almost certainly closing stock

The system carries **no inventory ledger**. The only stock-named account, `COUNTER STOCK`, sits under *Customer* with a nil balance. Stock actually in hand is **₹14,23,61,188.20** across 2,575 items (20,038.936 g net), which covers **93%** of the gap.

Decide: accept stock as the missing debit, or restate the openings.

9. About ₹1.09 crore remains unexplained after stock

Ledgers absent from the opening table account for only **₹9,32,490.95** of it.

Decide: how the residue is treated.

10. Barcode values are struck at current metal rates, not opening cost

An exact opening tie was therefore never available from this data.

For the CA: a view is needed on whether that basis is acceptable, and if not, what to substitute.

11. Confirm that stock was always held outside the ledgers

One confirmation. It releases the balance sheet.

12. One voucher of 1,848 does not balance

A **₹0.01** Paytm settlement journal. Separately, **eight journals worth ₹21,025.82 carry blank branch and year stamps** — all eight balance exactly, so they need a scope stamp, not an amount correction.

13. One voucher is dated in a financial year holding no other data

Decide: open that year as a stub, or re-date the voucher with sign-off.

14. Reconciliation stands at five of eight gates passing

Passing: row counts against the backup manifest · all 40,519 parties present with unique ledger codes · every voucher line resolves to a ledger, no orphans · money round-trips without loss across 10,000 amounts · **new reports match the legacy printed output** — invoice GST/2627/00215 ties at ₹93,786.00.

Failing: the trial balance (item 7) · one voucher out of balance (item 12) · the stock tie, on one duplicated barcode (item 40).

BLOCK 3 — GST and statutory

CA-led.

The GST position depends on which basis is used, and the difference is not small. Taken straight from the tax ledgers, across all the data:

	Credited	Debited	Net
Output — collected on sales	₹11,65,553.16	₹9,95,278.87	**₹1,70,274.29**
Input — paid on purchases	₹6,89,000.21	₹7,43,625.20	**−₹54,624.99**
Electronic credit ledger	₹1,18,838.00	₹1,96,262.00	**−₹77,424.00**

The gross and the net are far apart — output tax reads ₹11.66 lakh charged or ₹1.70 lakh net, depending on whether reversals are taken off. **The CA should say which basis the return was filed on**, because the register on screen can show either and nothing in the data settles it.

(An earlier draft quoted a single pair of figures for the year. They came from a report over one period rather than from the ledgers, and could not be reproduced from the data, so they have been replaced by the measurement above.)

15. ₹1,56,108.86 of IGST — 64% of the year's — on twenty bills whose own place of supply says West Bengal

₹52,04,145.00 of goods. The bills charged interstate tax while recording the supply as taking place in the shop's own state.

Decide: carried away from the counter (the wrong tax heads were used) or shipped out of state (the place of supply is wrong, and the return is filing them in the wrong section).

16. ₹28,94,996.21 of purchase value sits outside the taxable base

Of the 43 purchase bills, **every kind agrees between header and contents except one**: metal-only bills (8), stone-only bills (16) and bills carrying no weight either way (8) all tie **to the paisa**. **The 11 bills that mix metal and stones do not** — together they declare **₹94,25,561.95** taxable against contents worth **₹1,23,20,558.16**, a gap of **₹28,94,996.21**.

The pattern is exact enough to be a rule rather than an error: on a mixed bill the taxable value is the metal and the stones sit outside it.

Decide: is that how they were returned?

17. ₹16,354.29 of input credit claimed against a supplier with no GSTIN anywhere

An input credit rests on the supplier's registration number, and this one has none in the records.

18. Twenty B2B bills across three ledgers

The B2B section of the return keys on the buyer's registration number. Anything missing one cannot be filed.

19. There is no TDS data in the records at all

The old system had a TDS on Job Charge register and **no table behind it survived**. More telling: the TDS columns that DO survive were never used — `tds`, `tdsrate`, `tdsperc`, `calc_tds` and three more sit on the customer and ledger tables, and across **all 40,519 customer rows there is exactly one distinct value, and it is blank**. Not a rate, not a flag, nothing.

Decide: was TDS deducted on goldsmith job charges and recorded somewhere else, or was it never deducted? **Then:** if it was deducted, the Form 26Q returns are the only surviving record and the position has to be rebuilt from them. This is an income-tax filing, not a GST one.

20. Payroll cannot post until two ledgers are confirmed

P.TAX → 3242 PROFESSIONAL TAX — ₹6,140.00 credited matches the April to July sheets to the rupee. **D.A → 4291 DEARNESS ALLOWANCE** — ₹3,22,800.00.

21. Scheme liability: ₹77,48,300 across 173 completed schemes

173 customers have paid every instalment their scheme required — ₹71,01,000 in, against a maturity value of ₹77,48,300. **Not one of the 239 enrolments is marked closed**, and **237 have now passed their maturity date**, some since 2017.

Two notes on the counting. *Completed* here means the customer paid exactly the number of instalments the scheme called for; **one further customer paid more than required**, which is why a looser count gives 174 and ₹78,58,300. And the matured figure moves with the calendar — it was 235 when first measured and is 237 today.

Decide: were these handed over — and when a scheme matures, is it settled against a sale bill, cash out, or both?

22. Do you sell for export, and how is it taxed?

The menu has an Export Sale screen and **not one export sale has ever been raised** — the only sale types on record are GST sale, repair sale and estimate. An export is taxed one of two ways: zero-rated under a letter of undertaking, or IGST paid and reclaimed. Choosing wrong puts a wrong tax on a real bill.

If the shop does not export, say so and the screen comes off the list.

23. Do you sell at exhibitions, and should those bills be marked?

Same shape. If exhibition bills are ordinary GST bills, the existing sale screen is the answer. If they must be told apart — for a separate return or a separate till — that is a different screen.

BLOCK 4 — How the shop worked

Owner-led. These are things only somebody who was there can answer.

24. 24 pieces were billed by barcode that the tag master has no record of

₹9,26,698.00 across 14 bills, **₹7,11,438.00** of it on a single bill on 3 July — a ₹4,20,793 gold set among them.

Decide: bought in and sold the same day without being tagged?

25. The old test system ran bill numbers ahead of the shop's

83 of 135 of those numbers are also a real bill for a completely different sale. The gap widens steadily from 0 to 119 across 220 bills.

Decide: did an invoice printed by the test system ever leave the counter?

26. 105 repairing orders and not one repair bill

All 328 sale lines on record are GST sales.

Decide: is repair work billed here, and to which ledger?

27. Which hallmarking, certification and rhodium centres does the shop send to — and does it send at all?

The shop's own movement log hallmarked four tags in 2024-25 and names no centre.

28. Which ledgers take hallmarking and certification charges?

Neither ledger exists today. Two new codes, or two existing ones named.

29. How is a refiner's or a mint's charge booked?

In metal, as a bill from him, or as a payment against his account?

30. Does the shop send metal to a mint at all?

The records hold no mint movement.

Items 27 to 30 together release five screens.

31. 176 of 5,221 designs carry a flag nobody can interpret

Those 176 are dearer — **₹49,287** average against ₹28,619 — and more often stone-set, **68% against 48%**. Something selected them.

Decide: active, discontinued, featured, photographed? **Then:** guessing wrong would show a featured design as discontinued.

32. `D GENERAL` is written six ways across 394 tags worth ₹1,97,05,407

Spacing slips can be folded together. What cannot be decided from the data is whether these are one label or two: `SILVER JEWELLERY` / `SILVER JEWELERY`, `UTENSILS` / `UTENSIL`, `KOLKATA EXCLUSIVE` / `KOLKATA`, `D GENERAL` / `DIA GENERAL`.

33. ₹2,60,68,682 of stone — 2,554 carats — cannot be said to have gone in or come out

The stock journal carries a flag and the measurements point both ways.

Decide: does the flag mean tagged, or untagged?

34. Where is the raw metal now?

The records say the shop holds every gram of all ten rows, with no goldsmith and no party holding any — which sits oddly beside a report showing **146 issues**. The opening figure says **12,304.524 g** and the June report says **11,998.005 g**, **306.519 g apart**.

35. A daily coin list is kept every trading day, and nothing is billed from it

5,966 rows, 52 items, 115 days — and **not one of the 32 coin sales** was billed from it. Twenty-three were priced by weight at that day's metal rate.

Decide: what is the list for?

36. 83 carried-forward orders all show 1 April 2026 as their date

That is **29% of the order book**, and it is not their real date. The true date is not in the records, though the financial year is recoverable from the order number.

Decide: show them as *"carried forward from 2022-23"*, or find the date another way?

37. Twelve of the oldest orders, worth ₹17.10 lakh, have no delivery recorded

They are genuinely old — the order numbers carry the financial year to prove it.

38. Two customers' stones are still held against cancelled orders

RASHMI SARAF **2.750 ct**, held 58 days. POOJA PRASAD **4.150 ct**, held 34 days. **6.90 ct** between them.

Decide: kept back deliberately, or did the cancellation never reach the counter?

39. Two orders were billed above their locked rate

38323709 at **₹2,116.80** and 95831681R1 at **₹252.00**, both at that day's higher rate. Of 47 delivered order lines, 33 billed at exactly the locked rate and 12 below.

Decide: mistake or renegotiation — and should the till warn when a reserved tag is billed above its locked rate?

40. Two sales of SILVER EXCLUSIVE PCS billed ₹1,942 against a ₹650 tag

Three pieces at the tag price would be ₹1,950, so this may be a three-piece sale recorded as one.

41. Stock tagged in 2024 and 2025 turns ten times faster than older stock

The 251 pieces from 2023 or earlier are worth **₹14,00,024.17**; **₹8,30,06,909.33** of the ₹8.51 crore was tagged in the last two years.

Decide: is 1.7% turnover on the older stock what you expect?

42. MADHURIMA DAS is paid nought every even month and ₹21,100 every odd one

Without exception since June 2025 — seven sheets of nothing across sixteen months.

Decide: is that how she works, or is her pay entered every second month?

BLOCK 5 — Scope and cost

Each of these decides whether work happens at all.

43. Is the manufacturing work worth building?

Across **2.5 years of complete audit trail**, hallmarking appears **8 times** and goldsmith issue-and-receive **not once**. Building it is roughly **10 to 14 weeks**.

Decide: build it, or leave the goldsmith screens read-only.

44. If it is built, where does the knowledge come from?

Sixteen of those screens were never captured and their code is gone. Staff interviews, printed reports, the old vendor, or designing it fresh.

45. Will billing still work if the shop's internet drops?

The system will run on a cloud server. Today's assumption is **online-only, with no offline queue**. If that is wrong, the billing screen needs rebuilding rather than a setting changed.

46. Do you want a screen for customers' and suppliers' bank details?

The records hold **398 bank accounts** — 397 with an IFSC, 396 with a plausible account number, 380 in valid format. Paying a goldsmith or supplier by transfer needs exactly this and there is no way to look one up today. The old system had no such screen either, so it sits outside the rebuild, but it is a morning's work.

One caveat: 141 of the 398 name an owner that matches no ledger and no party — bank details attached to somebody the system cannot resolve.

47. Should there be a rights editor, or is the audit report enough?

The old menu had both. This system has the report.

48. When two ledgers are merged, should history be re-pointed?

Re-pointing is real and **cannot be undone**. The alternative is to make the merged ledger an alias that reports fold together.

BLOCK 6 — Fast confirmations

Short answers. Twenty minutes for the lot.

49. ₹900 of stock that does not exist

Barcode `86065435` is entered twice for one physical tag. **Nothing will be deleted without approval.**

50. `SILVER PICHKARY` appears twice in the catalogue

Item **1063** and item **1156**, identical in every attribute — group, subgroup, type, unit, rate and HSN — and neither carries a barcode.

51. Five stock items use a purity code that is not in the purity master

₹10,000 between them.

52. Hold a printed label against a real tag

The old system's label-printing screens failed when the data was captured, so the layout was never recovered. This confirms the layout and the unit.

53. Should the `rps` login keep all four override rights?

Of 24 logins, **only two hold all four** — posting into a closed period, changing the gold rate, editing tags, and moving due dates. `rps` **holds all four; GKS, the SUPER ADMIN, cannot post into a closed period.**

Posting into a closed period is the right that matters for an audit, because back-dating is what hides things.

Three things we are doing, not asking

Listed so the room knows they are in hand.

Getting the captured records off a single laptop. It is the only copy of **40,519 customer records**. A failed disk would end the project.

Rotating the message-service credentials. They are live, and they sit in a copy of the database that has already been moved between machines. Two screens stay deliberately shut until this is done.

Checking whether the tag photographs still exist. 889 tags worth ₹10,73,39,445 — 75% of the shelf — are photographed only on servers the shop does not control, 3,923 of them over an unencrypted connection, with no local copy. If those images have been deleted they are gone, and opening one in a browser is what tells us.

What a sign-off needs

For the CA to rely on the books, six things must be settled:

1. A view on the **₹15.32 crore opening imbalance** — accept stock as the missing debit, or restate.
2. A decision on the **₹1.09 crore** that stock does not explain.
3. The **stock valuation basis**, and whether current-rate barcode values are acceptable.
4. Confirmation that **stock was always held outside the ledgers**.
5. A position on the **IGST place of supply** and the **mixed-bill taxable base**.
6. Whether the **₹8.8 crore of opening balances with no postings** are live receivables.

For the rebuild to finish, the one that matters most is **item 5** — the gold issued to MA TARA JEWELLERS. It settles ₹1.34 crore and releases fourteen screens on its own.
